Website Project Proposal

Student: ST10499221

Chosen organisation: Samukele Trading and Projects (Pty) Ltd

Project: Transport and abnormal load escort information website

Revision: 25 September 2026, following Part 1 feedback

Organisation overview

The Part 1 submission describes Samukele as a South African small business focused on transport support and abnormal load escort services. Its date of establishment, staff biographies, registration details and operational credentials were not supplied; these require verification with the organisation. Proposed mission: help coordinate abnormal load movements safely and efficiently. Proposed vision: become a trusted contact for route planning and escort support. Target users are transport operators, logistics managers, construction and mining firms.

Existing website and goals

The Part 1 proposal states that the organisation had no website. This has not been independently verified. The proposed site aims to establish an accessible online presence, explain services and let a prospective client prepare a route enquiry. Measurable targets for a three-month launch review: 50 relevant visits per month; 10 completed enquiries per month; all eight pages available on desktop and mobile; no internal broken links. These are proposed targets, not recorded results.

Scope

Eight pages: Home, About, Services, Compliance & Safety, Service Areas, Gallery, Request a Quote and Contact. The site uses semantic HTML, a shared external CSS file, responsive layouts, source images from the original submission and an email-app form for demonstration. The site does not process or store form data. Server-side submission, verified office details, credentials, map markers, testimonials and a company profile PDF require client information and belong to a future phase.

Visual approach

Safety yellow, charcoal, white and a warm light background create a strong transport identity. Clear headings, legible text, a consistent navigation bar and prominent quote links help users find the next action. Desktop uses Grid and Flexbox; tablet wraps navigation; mobile displays one-column content.

Timeline and milestones

Milestone • Estimated time • Output

Confirm organisation content and image rights • 2 days • Approved copy and assets

Plan sitemap and wireframes • 2 days • Page map and layouts

Repair Part 1 HTML and documentation • 3 days • Working pages and README

Build Part 2 desktop CSS • 3 days • Shared stylesheet

Tablet and mobile refinement • 2 days • Breakpoints and responsive images

Cross-device review and corrections • 2 days • Screenshot evidence and issue log

Repository submission • 1 day • Commits, push and LMS link

Illustrative budget (ZAR)

Item • Estimate • Basis

Research, content review and wireframes • R2,400 • 12 hours at R200/hour

HTML/CSS implementation • R6,400 • 32 hours at R200/hour

Testing and documentation • R1,600 • 8 hours at R200/hour

Domain and hosting, first year • R1,500 • Planning allowance, supplier quote required

Maintenance, first year • R2,400 • 2 hours/month at R100/hour

Estimated first year • R14,300 • Excludes VAT and paid integrations

This is a planning estimate, not a vendor quote. Confirm current supplier pricing and client scope before procurement.

Source and approval notes

Original material: student's Part 1 proposal, HTML pages and four submitted images (see research/). The assignment screenshots and lecturer feedback directed this revision. No external factual claim about certification, road permissions, company history or locations is asserted as verified. Refer to README.md for the full source register and outstanding confirmations.
